Profile

I'm a Seattle-based software engineer currently building financial analysis software for large businesses. I'm looking to start the next phase of my career, seeking roles that will present new challenges and allow me to enhance and broaden my technical skillset. I can't wait to join your team.

Skills

Programming Languages

Typescript, Python, Java, C#

Frameworks

NodeJS, Express, FastAPI, Django, Quarkus, Angular, React

DevOps & Cloud

Git, Docker, Kubernetes, Helm, Jenkins, Github Actions, Network Administration, Server Management, AWS, Azure, Digitalocean, Cloudflare

Miscellaneous

AI Programming Aids, Playwright, Linux, Unity C# Scripting, PC Building

Professional Experience

Software Development Engineer III

CWAN (formerly Clearwater Analytics)

07/2022 – Present | Seattle, WA

- Planned, advocated for, and executed a transition from an aging internal Angular-based component library to a fully React-based UI, increasing velocity without disrupting active development, saving >1000 developer hours from being spent on duplicative work over the course of the transition.
- Proactively audited security vulnerabilities in backend software, coordinated with infosec team to ensure secure client data storage and usage.
- Led an effort to deprecate unreliable testing pipelines, resulting in almost 3x faster project build times and decreased CI/CD agent costs.
- Implemented a system allowing for individual overrides for data points derived from automated sources, reducing client headaches when dealing with outdated or erroneous datasets.
- Planned and implemented a library for distributing and updating common style and white label attributes for both Vanilla JS and React UI applications.
- As a trusted resource within the UI/UX development community within the company, I've pushed for higher quality documentation and more meaningful product requirements in order to reduce the amount of developer time spent doing non-development tasks.
- Promoted from level II to level III in January 2025.

Contract Software Engineer

MHISystems, Inc

05/2022 – 10/2022 | Sterling, VA (Remote)

- Designed, developed, and managed deployment of a platform enabling mental healthcare providers to create assessments, define scoring criteria, and assign assessments to their patients.
- Allowed migration away from their previous, hard-coded assessment systems. Saving on developer cost and granting providers decreased manual workload and increased autonomy.
- Coordinated with internal developers to integrate the new platform with their existing identity and auth structure.

Full-Stack Engineer

Press Hook

09/2021 – 07/2022 | New York, NY (Remote)

- Aided transition from third-party dev shop to internal development.
- Designed and developed a custom contextual messaging solution with Django and React with Websockets.
- Migrated CI/CD processes from Cloudbees to Github Actions, newer, simplified pipelines lead to 2x faster builds, reducing server time cost.
- Reduced initial page load times by 90% and content load times from >10s to <100ms by implementing lazy-loading and migrating on-the-fly related content resolution to a pre-calculated data model.
- Transitioned vanilla JavaScript to React for front-end components, improving development ease and velocity.

Highlighted Projects

Homelab Kubernetes Cluster

Kubernetes (K3S), Helm, Docker, Cloudflare

A 100% self-managed high availability Kubernetes cluster utilizing recycled hardware.

Used to deploy scalable workloads for personal projects and my media server utilizing helm charts.

- Utilized by myself, friends, and family, with up to 20k requests served on a daily basis.
- 6 agent nodes: 3 Raspberry Pis and 3 recycled computers, with 2 redundant server nodes for high availability.
- Validated resiliency to hardware, power, and drive failures, enabling uptime for external access to be nearly 1:1 with my ISP.
- Zero direct exposure of local nodes to the outside world using Wireguard, a proxy VPS server, strict firewall rules, and Cloudflare.

Unity Jubeat Rewrite

Unity, C#, NodeJS, Python, Arduino, After Effects, Photoshop

A home-brew implementation of the rhythm game *Jubeat*, typically only playable in Japan, in Unity.

- Utilized a hard drive scrapped from a retired machine to obtain and reverse engineer chart asset files and formats.
- Assembled my own controller using hand tools, a salvaged control panel from a real machine, a microcontroller, and a monitor.
- Deployed a web service for serving content at runtime to reduce application size for running on iPadOS.
- Implemented in-game UI, animation timing, accuracy scoring, and input for both touch screens and my custom controller.
- Designed and created my own sprites and animations using Adobe After Effects and Photoshop.
- Went from zero Unity and minimal C# experience to a functional prototype over two days, highlighting my skill acquisition ability.
