

Dawn Sheedy

Software Engineer

Seattle, WA

dawnsheedy.com

Profile

Seattle-based engineer with 5 years of working experience. Currently building identity and access management software. Experienced in all phases of the SDLC, from planning to long term support. I'm always looking for new challenges.

Skills

Programming Languages

Typescript, Python, Java, C#

Frameworks

BE: NodeJS, Express, FastAPI, Django, Quarkus | UI: Angular, React

Other

Git, JIRA, Docker, Kubernetes, Helm, Jenkins, Github Actions, Network Administration, AWS, Azure, Digitalocean, Cloudflare, AI Programming Tools

Education

Computer Science

Virginia Commonwealth University

2019 – 2021 | Richmond, VA
Attended

Professional Experience

Software Development Engineer III

CWAN (formerly Clearwater Analytics)

07/2022 – Present | Seattle, WA

- Planned, advocated for, and executed a transition from an aging internal Angular-based component library to a fully React-based UI, increasing velocity without disrupting active development, saving >1000 developer hours from being spent on duplicative work over the course of the transition.
- Proactively audited security vulnerabilities both manually and with AI tooling, coordinated with infosec team to ensure secure client data storage and usage.
- Led an effort to deprecate and replace unreliable testing pipelines, resulting in almost 3x faster project build times and decreased CI/CD agent costs.
- Utilized AI programming tools and agentic pipelines as a development accelerator.
- Planned and implemented a library for distributing and updating common style and white label attributes for both Vanilla JS and React UI applications.
- As a trusted resource within the UI/UX development community within the company, I've pushed for higher quality documentation and more meaningful product requirements in order to reduce the amount of developer time spent doing non-development tasks.
- Promoted from level II to level III in January 2025.
- Currently working on identity and access management systems for our multi-tenant architecture, these tools are depended on across the entire company.

Software Engineer (Contract)

MHISystems, Inc

05/2022 – 10/2022 | Remote

- Designed, developed, and managed deployment of a platform enabling mental healthcare providers to digitize conduction and scoring for assessments such as PHQ-9.
- Allowed migration away from their previous, hard-coded assessment systems. Saving on developer cost and granting providers decreased manual workload and increased autonomy to add and assign additional assessments.
- Coordinated with internal developers to integrate the new platform with their existing identity and auth structure.

Full-Stack Engineer

Press Hook

09/2021 – 07/2022 | Remote

- Aided transition from third-party development team to internal development.
- Designed and developed a custom contextual messaging solution with Django, Redis, and React with Websockets..
- Migrated CI/CD processes from Cloudbees to Github Actions, newer, simplified pipelines lead to 2x faster builds, reducing server time cost.
- Reduced initial page load times by 90% and content load times from as high as 10s to <50ms by implementing lazy-loading and migrating on-the-fly related content resolution to a pre-calculated data model.
- Transitioned vanilla JavaScript to React for front-end components, improving development ease and velocity.

Highlighted Personal Projects

Homelab Kubernetes Cluster

Kubernetes (K3S), Helm, Docker, Cloudflare

A 100% self-managed high availability Kubernetes cluster utilizing recycled hardware. Built as a practice and passion project. Used to deploy workloads for personal projects and my media server utilizing helm charts.

- Utilized by myself, friends, and family, with up to 20k requests served on a daily basis.
- 8 agent nodes: 3 Raspberry Pis and 5 recycled computers, with 3 redundant server nodes for high availability.
- Validated resiliency to hardware, power, and drive failures, enabling uptime for external access to be nearly 1:1 with my ISP.

Unity Jubeat Rewrite

Unity, C#, NodeJS, Python, Arduino, After Effects, Photoshop (2022, before major LLMs and AI coding tools)

An interdisciplinary project recreating a home-brew version of the rhythm game *Jubeat*, typically only playable in Japan, in Unity.

- Utilized a hard drive scrapped from a retired machine to obtain and reverse engineer chart asset files and formats.
- Assembled my own controller using hand tools, a salvaged control panel from a real machine, a microcontroller, and a monitor.
- Deployed a web service for serving content at runtime to reduce application size for running on iOS.
- Implemented in-game UI, animation timing, accuracy scoring, and input for both touch screens and my custom controller.
- Designed and created my own sprites and animations using Adobe After Effects and Photoshop.
- From zero Unity and little C# experience to a functional prototype over two days, highlighting my skill acquisition ability.
